

Adaptive case-tailoring of structured precision therapeutics-focused reasoning with mimicked self-determination mechanism: precision therapeutic decision support system delivering structured reports

Performance – private leaderboard score

Track 1: Internal model reasoning	0.80717
Track 2: Agentic tool-augmented reasoning	0.7939

Core prompting strategies

Structured scaffolding	three-section output structure
Question adaptivity	dynamic system prompt
Escape mechanism	undeterminable as an option
Qualifying language	required uncertainty markers

Technical details

Models used	ollama/gpt-oss:120b; ollama/gpt-oss:20b
Tools source	Tooluniverse (FDA)

Summary

Curaive structures clinical reasoning through patient-first analysis, meta-cognitive scaffolding, and case-tailored prompting that adapts to question type and clinical context. It prioritizes patient context when applicable before establishing case-specific decision frameworks and quality standards that guide analysis. Explicit escape mechanisms mitigate fabrication by embedding qualified language for uncertainty. The architecture demonstrates that guiding models to tailor reasoning uniquely with a proposed structure for each case, rather than applying generic patterns, produces efficient answers.

CLINICAL QUESTION

A 35-year-old woman with moderate-to-severe atopic dermatitis presents with recurrent pruritus, facial erythema, and flexural lichenification. She has a history of food intolerance and increased circulating IgE concentration. Previous topical corticosteroid therapy has failed to control her symptoms. She is not pregnant, does not have any active infections, and is not taking any immunosuppressive medications. Which drug regimen is most appropriate for her ongoing management?

CURAIVE ANALYSIS

SECTION 0 – PATIENT

Characteristic	Detail
Age / Sex	35-year-old woman
Disease severity	Moderate-to-severe atopic dermatitis (persistent pruritus, facial erythema, flexural lichenification)
Prior therapy	Topical corticosteroids (ineffective)
Comorbidities / History	Food intolerance, elevated serum IgE
Pregnancy status	Not pregnant
Active infections	None
Current immunosuppressive drugs	None
Relevant labs / vitals	Not provided (assume within normal limits)

SECTION 1 – PRECISION THERAPEUTICS BRIEFING PACKAGE

Clinical Decision Point

Select the most appropriate drug regimen for an adult with moderate-to-severe atopic dermatitis that has not responded to topical corticosteroids and who has no contraindicating conditions.
